Colored Link Homology

Definition

Invariance

Open Problems and More

- ▶ I will introduce an $\mathfrak{sl}(N)$ -homology associated to links colored by integers, which generalizes the Khovanov-Rozansky $\mathfrak{sl}(N)$ -homology.
- ▶ The construction of this colored $\mathfrak{sl}(N)$ -homology uses matrix factorizations over rings of symmetric polynomials.
- ▶ I conjecture that this colored $\mathfrak{sl}(N)$ -homology decategorifies to the quantum $\mathfrak{sl}(N)$ -polynomial of links colored by exterior powers of the defining representation.

Rings of Symmetric and Partially Symmetric Polynomials

- ▶ An alphabet is a set $\mathbb{X} = \{x_1, \dots, x_m\}$ of finitely many indeterminants. Denote by $\text{Sym}(\mathbb{X})$ the ring of symmetric polynomials in \mathbb{X} with complex coefficients. The grading on $\text{Sym}(\mathbb{X})$ is given by $\deg x_j = 2$.

Rings of Symmetric and Partially Symmetric Polynomials

- ▶ An alphabet is a set $\mathbb{X} = \{x_1, \dots, x_m\}$ of finitely many indeterminants. Denote by $\text{Sym}(\mathbb{X})$ the ring of symmetric polynomials in \mathbb{X} with complex coefficients. The grading on $\text{Sym}(\mathbb{X})$ is given by $\deg x_j = 2$.
- ▶ Let $\mathbb{X}_1, \dots, \mathbb{X}_l$ be a collection of pairwise disjoint alphabets. Denote by $\text{Sym}(\mathbb{X}_1 | \dots | \mathbb{X}_l)$ the ring of polynomials in $\mathbb{X}_1 \cup \dots \cup \mathbb{X}_l$ over \mathbb{C} that are symmetric in each \mathbb{X}_i , which is naturally a $\text{Sym}(\mathbb{X}_1 \cup \dots \cup \mathbb{X}_l)$ -module. This is a free module whose structure is known.

Simple Symmetric Polynomials

For an alphabet $\mathbb{X} = \{x_1, \dots, x_m\}$,

elementary:
$$X_k := \sum_{1 \leq i_1 < i_2 < \dots < i_k \leq m} x_{i_1} x_{i_2} \cdots x_{i_k},$$

complete:
$$h_k(\mathbb{X}) := \sum_{1 \leq i_1 \leq i_2 \leq \dots \leq i_k \leq m} x_{i_1} x_{i_2} \cdots x_{i_k},$$

power sum:
$$p_k(\mathbb{X}) := \sum_{i=1}^m x_i^k.$$

Simple Symmetric Polynomials

For an alphabet $\mathbb{X} = \{x_1, \dots, x_m\}$,

elementary: $X_k := \sum_{1 \leq i_1 < i_2 < \dots < i_k \leq m} x_{i_1} x_{i_2} \dots x_{i_k},$

complete:
$$h_k(\mathbb{X}) := \sum_{1 \leq i_1 \leq i_2 \leq \dots \leq i_k \leq m} x_{i_1} x_{i_2} \cdots x_{i_k},$$

power sum: $p_k(\mathbb{X}) := \sum_{i=1}^m x_i^k.$

$$\begin{aligned}\mathrm{Sym}(\mathbb{X}) &= \mathbb{C}[X_1, \dots, X_m] = \mathbb{C}[h_1(\mathbb{X}), \dots, h_m(\mathbb{X})] \\ &= \mathbb{C}[p_1(\mathbb{X}), \dots, p_m(\mathbb{X})]\end{aligned}$$

Cohomology of Complex Grassmannian

Denote by $G_{m,N}$ the complex (m, N) Grassmannian. Let \mathbb{X} and \mathbb{Y} be alphabets of m and $N - m$ indeterminants.

- Usual cohomology:

$$H^*(G_{m,N}; \mathbb{C}) \cong \text{Sym}(\mathbb{X}) / (h_{N+1-m}(\mathbb{X}), h_{N+2-m}(\mathbb{X}), \dots, h_N(\mathbb{X}))$$

as graded \mathbb{C} -algebras.

Cohomology of Complex Grassmannian

Denote by $G_{m,N}$ the complex (m, N) Grassmannian. Let \mathbb{X} and \mathbb{Y} be alphabets of m and $N - m$ indeterminants.

- ▶ Usual cohomology:

$$H^*(G_{m,N}; \mathbb{C}) \cong \text{Sym}(\mathbb{X}) / (h_{N+1-m}(\mathbb{X}), h_{N+2-m}(\mathbb{X}), \dots, h_N(\mathbb{X}))$$

as graded \mathbb{C} -algebras.

- ▶ $GL(N; \mathbb{C})$ -equivariant cohomology:

$$H_{GL(N; \mathbb{C})}^*(G_{m,N}; \mathbb{C}) \cong \text{Sym}(\mathbb{X} | \mathbb{Y})$$

as graded $\text{Sym}(\mathbb{X} \cup \mathbb{Y})$ -algebras.

Grading Shifts

Let M be a graded vector space. For $j \in \mathbb{Z}$, define $M\{q^j\}$ to be M with grading shifted by j , i.e. $M\{q^j\} = M$ as ungraded R -modules and, for every homogeneous element $m \in M$, $\deg_{M\{q^j\}} m = j + \deg_M m$. More generally, let $f(q) = \sum_{j=k}^l a_j q^j$ be a Laurent polynomial whose coefficients are non-negative integers. Define

$$M\{f(q)\} = \bigoplus_{j=k}^l \underbrace{(M\{q^j\} \oplus \cdots \oplus M\{q^j\})}_{a_j\text{-fold}}.$$

Quantum Integers

Quantum integers are a particular class of such Laurent polynomials. We use the following definitions:

$$[j] := \frac{q^j - q^{-j}}{q - q^{-1}},$$

$$[j]! := [1] \cdot [2] \cdots [j],$$

$$\begin{bmatrix} j \\ k \end{bmatrix} := \frac{[j]!}{[k]! \cdot [j-k]!}.$$

It is well known that

$$\begin{bmatrix} m+n \\ n \end{bmatrix} = q^{-mn} \sum_{\lambda=(\lambda_1 \geq \dots \geq \lambda_m): l(\lambda) \leq m, \lambda_1 \leq n} q^{2|\lambda|}.$$

Graded Matrix Factorizations

Fix an integer $N > 0$. Let R be a graded commutative unital \mathbb{C} -algebra, and w a homogeneous element of R with $\deg w = 2N + 2$.

A graded matrix factorization M over R with potential w is a collection of two graded free R -modules M_0, M_1 and two homogeneous R -module homomorphisms $d_0 : M_0 \rightarrow M_1$, $d_1 : M_1 \rightarrow M_0$ of degree $N + 1$, called differential maps, s.t.

$$d_1 \circ d_0 = w \cdot \text{id}_{M_0}, \quad d_0 \circ d_1 = w \cdot \text{id}_{M_1}.$$

We usually write M as

$$M_0 \xrightarrow{d_0} M_1 \xrightarrow{d_1} M_0.$$

Koszul Matrix Factorizations

If $a_0, a_1 \in R$ are homogeneous s.t. $\deg a_0 + \deg a_1 = 2N + 2$, then denote by $(a_0, a_1)_R$ the graded matrix factorization

$$R \xrightarrow{a_0} R\{q^{N+1-\deg a_0}\} \xrightarrow{a_1} R,$$

which has potential $a_0 a_1$.

Koszul Matrix Factorizations (cont'd)

More generally, if $a_{1,0}, a_{1,1}, \dots, a_{k,0}, a_{k,1} \in R$ are homogeneous with $\deg a_{j,0} + \deg a_{j,1} = 2N + 2$, then define

$$\begin{pmatrix} a_{1,0} & a_{1,1} \\ a_{2,0} & a_{2,1} \\ \dots & \dots \\ a_{k,0} & a_{k,1} \end{pmatrix}_R$$

to be the tensor product

$$(a_{1,0}, a_{1,1})_R \otimes_R (a_{2,0}, a_{2,1})_R \otimes_R \cdots \otimes_R (a_{k,0}, a_{k,1})_R,$$

which is a graded matrix factorization with potential

$$\sum_{j=1}^k a_{j,0} \cdot a_{j,1}.$$

The Categories $\text{HMF}_{R,w}$ and $\text{hmf}_{R,w}$

If M, M' are both graded matrix factorizations over R with potential w , then $\text{Hom}_R(M, M')$ is a graded \mathbb{Z}_2 -chain complex of R -modules. Its homology, $\text{Hom}_{\text{HMF}}(M, M')$, is the R -module of homotopy classes of morphisms of matrix factorizations from M to M' . Denote by Hom_{hmf} the \mathbb{C} -subspace of $\text{Hom}_{\text{HMF}}(M, M')$ of homogenous elements of bi-degree $(0, 0)$.

Category	Objects	Morphisms
$\text{HMF}_{R,w}$	all homotopically finite graded matrix factorizations over R of potential w with quantum gradings bounded below	Hom_{HMF}
$\text{hmf}_{R,w}$	same as above	Hom_{hmf}

The Krull-Schmidt Property

An additive category \mathcal{C} is called Krull-Schmidt if

- ▶ every object of \mathcal{C} is isomorphic to a finite direct sum $A_1 \oplus \cdots \oplus A_n$ of indecomposable objects of \mathcal{C} ;
- ▶ and, if $A_1 \oplus \cdots \oplus A_n \cong A'_1 \oplus \cdots \oplus A'_l$, where $A_1, \dots, A_n, A'_1, \dots, A'_l$ are indecomposable objects of \mathcal{C} , then $n = l$ and there is a permutation σ of $\{1, \dots, n\}$ such that $A_i \cong A'_{\sigma(i)}$ for $i = 1, \dots, n$.

Theorem (Khovanov-Rozansky)

If R is a polynomial ring with homogeneous indeterminants of positive gradings and w is a homogeneous element of R with $\deg w = 2N + 2$, then $\mathrm{hmf}_{R,w}$ and $\mathrm{hCh}^b(\mathrm{hmf}_{R,w})$ are both Krull-Schmidt, where $\mathrm{hCh}^b(\mathrm{hmf}_{R,w})$ is the homotopy category of bounded chain complexes over $\mathrm{hmf}_{R,w}$.

MOY Graphs

An (embedded) MOY graph is an oriented plane graph with each edge colored by a non-negative integer such that

- ▶ for every vertex v with valence at least 2, the sum of integers coloring the edges entering v is equal to the sum of integers coloring the edges leaving v ,
- ▶ through each such vertex v of Γ , there is a straight line L_v so that all the edges entering v enter through one side of L_v and all edges leaving v leave through the other side of L_v .

Markings

A marking of an MOY graph Γ consists the following:

1. A finite collection of marked points on Γ such that
 - ▶ every edge of Γ has at least one marked point;
 - ▶ all the end points (vertices of valence 1) are marked;
 - ▶ none of the interior vertices (vertices of valence at least 2) is marked.
2. An assignment of pairwise disjoint alphabets to the marked points such that the alphabet associated to a marked point on an edge of color m has m indeterminants.

The Matrix Factorization Associated to a Vertex

Let $\mathbb{X} = \mathbb{X}_1 \cup \dots \cup \mathbb{X}_k$ and $\mathbb{Y} = \mathbb{Y}_1 \cup \dots \cup \mathbb{Y}_l$. Denote by X_j and Y_j the j -th elementary symmetric polynomials in \mathbb{X} and \mathbb{Y} .

$$C(v) := \begin{pmatrix} U_1 & X_1 - Y_1 \\ U_2 & X_2 - Y_2 \\ \dots & \dots \\ U_m & X_m - Y_m \end{pmatrix}_{\text{Sym}(\mathbb{X}_1 | \dots | \mathbb{X}_k | \mathbb{Y}_1 | \dots | \mathbb{Y}_l)} \{q^{-\sum_{1 \leq s < t \leq k} i_s i_t}\},$$

where U_j is homogeneous of degree $2N + 2 - 2j$ and $\sum_{j=1}^m (X_j - Y_j) U_j = p_{N+1}(\mathbb{X}) - p_{N+1}(\mathbb{Y})$.

Decompositions (I & II)

$$(I) \quad C(\text{diagram}) \simeq C(\text{diagram}) \{ \begin{bmatrix} N-m \\ n \end{bmatrix} \} \langle n \rangle.$$

The diagram on the left shows a vertical line with an upward arrow labeled m at the top and a downward arrow labeled m at the bottom. A loop is attached to the line, with an upward arrow labeled n on its left side and a downward arrow labeled n on its right side. The label $m+n$ is placed to the left of the loop.

The diagram on the right shows a vertical line with an upward arrow labeled m at the top.

$$(II) \quad C(\text{diagram}) \simeq C(\text{diagram}) \{ \begin{bmatrix} m+n \\ n \end{bmatrix} \}.$$

The diagram on the left shows a vertical line with an upward arrow labeled $m+n$ at the top and a downward arrow labeled $m+n$ at the bottom. A loop is attached to the line, with an upward arrow labeled n on its left side and a downward arrow labeled n on its right side. The label m is placed to the left of the loop.

The diagram on the right shows a vertical line with an upward arrow labeled $m+n$ at the top.

Decompositions (III & IV)

$$(III) \quad C\left(\begin{array}{c} \begin{array}{ccc} & \nearrow & \\ 1 & & m \\ & \nwarrow & \\ & \nearrow & \\ m & & 1 \\ & \nwarrow & \\ & \nearrow & \\ 1 & & m \end{array} \end{array} \right) \simeq C\left(\begin{array}{c} \uparrow \\ 1 \end{array} \right) \downarrow_m \oplus C\left(\begin{array}{c} \begin{array}{ccc} & \nearrow & \\ 1 & & m \\ & \nwarrow & \\ & \nearrow & \\ & m-1 & \\ & \nwarrow & \\ & \nearrow & \\ 1 & & m \end{array} \end{array} \right) \{[N-m-1]\} \langle 1 \rangle.$$

$$(IV) \quad C\left(\begin{array}{c} \begin{array}{ccc} \uparrow & & \uparrow \\ l & & m \\ \hline \rightarrow & & \\ n & & \\ \hline \leftarrow & & \\ l+n-1 & & \\ \hline \uparrow & & \uparrow \\ 1 & & m+l-1 \end{array} \end{array} \right) \simeq C\left(\begin{array}{c} \begin{array}{ccc} \uparrow & & \uparrow \\ l & & m \\ \hline \leftarrow & & \\ l-1 & & \\ \hline \uparrow & & \uparrow \\ 1 & & m+l-1 \end{array} \end{array} \right) \{[m-1]_n\} \oplus C\left(\begin{array}{c} \begin{array}{ccc} \nearrow & & \nearrow \\ l & & m \\ \hline \downarrow & & \\ m+l & & \\ \hline \nearrow & & \nearrow \\ 1 & & m+l-1 \end{array} \end{array} \right) \{[m-1]_n\}.$$

Decompositions (V)

$$(V) \quad C \left(\begin{array}{c} m \uparrow \quad \quad \uparrow n+l \\ \xrightarrow{n+k-m} \\ n+k \quad \quad m+l-k \\ \xleftarrow{k} \\ n \quad \quad m+l \end{array} \right) \simeq \bigoplus_{j=\max\{m-n,0\}}^m C \left(\begin{array}{c} m \uparrow \quad \quad \uparrow n+l \\ \xleftarrow{j} \\ m-j \quad \quad n+l+j \\ \xrightarrow{n+j-m} \\ n \quad \quad m+l \end{array} \right) \{ \begin{bmatrix} l \\ k-j \end{bmatrix} \}.$$

$$l = 0 \Rightarrow C \left(\begin{array}{c} m \uparrow \quad \quad \uparrow n \\ \xrightarrow{n+k-m} \\ n+k \quad \quad m-k \\ \xleftarrow{k} \\ n \quad \quad m \end{array} \right) \simeq C \left(\begin{array}{c} m \uparrow \quad \quad \uparrow n \\ \xleftarrow{k} \\ m-k \quad \quad n+k \\ \xrightarrow{n+k-m} \\ n \quad \quad m \end{array} \right).$$

$$l = 1 \Rightarrow C \left(\begin{array}{c} m \uparrow \quad \quad \uparrow n+1 \\ \xrightarrow{n+k-m} \\ n+k \quad \quad m+1-k \\ \xleftarrow{k} \\ n \quad \quad m+1 \end{array} \right) \simeq C \left(\begin{array}{c} m \uparrow \quad \quad \uparrow n+1 \\ \xleftarrow{k} \\ m-k \quad \quad n+1+k \\ \xrightarrow{n+k-m} \\ n \quad \quad m+1 \end{array} \right) \oplus C \left(\begin{array}{c} m \uparrow \quad \quad \uparrow n+1 \\ \xleftarrow{k-1} \\ m-k+1 \quad \quad n+k \\ \xrightarrow{n+k-1-m} \\ n \quad \quad m+1 \end{array} \right).$$

Marking of Colored Link Diagrams

Recall that N is a fixed positive integer. (It is the “ N ” in “ $\mathfrak{sl}(N)$ ”.) Given a diagram D of a link whose components are colored by integers $\in \{1, \dots, N\}$. A marking of D consists the following:

1. A finite collection of marked points on D such that
 - ▶ every arc between two crossings has at least one marked point;
 - ▶ none of the crossings is marked.
2. An assignment of pairwise disjoint alphabets to the marked points such that the alphabet associated to a marked point on an arc of color m has m indeterminants.

The Chain Complex of a Colored Crossing

Assume $n \geq m$ and temporarily forget the quantum grading shifts.

$C(\text{crossing})$ should be an object of $\text{hCh}^b(\text{HMF})$ of the form

$$0 \rightarrow C(\text{crossing}) \xrightarrow{d_m^+} \dots \xrightarrow{d_{k+1}^+} C(\text{graph}_k) \xrightarrow{d_k^+} C(\text{graph}_{k-1}) \xrightarrow{d_{k-1}^+} \dots \xrightarrow{d_1^+} C(\text{graph}_0) \rightarrow 0,$$

where d_k^+ is homogeneous of quantum degree 1.

If we assume d_k^+ is not homotopic to 0, then there is a unique chain complex of this form. (If $m = n = 1$, then this chain complex is isomorphic to that defined by Khovanov and Rozansky.)

The Chain Complex of a Colored Crossing (cont'd)

- The lowest quantum grading of

$$\mathrm{Hom}_{\mathrm{HMF}}\left(C\left(\begin{array}{c} \begin{array}{cc} \uparrow m & \uparrow n \\ \hline \leftarrow k & \rightarrow m-k \\ \hline \uparrow n & \uparrow m \end{array} \end{array}\right), C\left(\begin{array}{c} \begin{array}{cc} \uparrow m & \uparrow n \\ \hline \leftarrow k-1 & \rightarrow m-k+1 \\ \hline \uparrow n & \uparrow m \end{array} \end{array}\right)\right)$$

is 1 and the space of homogeneous elements of quantum degree 1 is 1-dimensional.

The Chain Complex of a Colored Crossing (cont'd)

- ▶ The lowest quantum grading of

$$\mathrm{Hom}_{\mathrm{HMF}}\left(C\left(\begin{array}{c} \begin{array}{cc} \uparrow m & \uparrow n \\ | & | \\ \leftarrow k & \rightarrow k \\ | & | \\ \uparrow n & \uparrow m \end{array} \end{array}\right), C\left(\begin{array}{c} \begin{array}{cc} \uparrow m & \uparrow n \\ | & | \\ \leftarrow k-1 & \rightarrow k-1 \\ | & | \\ \uparrow n & \uparrow m \end{array} \end{array}\right)\right)$$

is 1 and the space of homogeneous elements of quantum degree 1 is 1-dimensional.

- ▶ The lowest quantum grading of

$$\mathrm{Hom}_{\mathrm{HMF}}\left(C\left(\begin{array}{c} \begin{array}{cc} \uparrow m & \uparrow n \\ | & | \\ \leftarrow k & \rightarrow k \\ | & | \\ \uparrow n & \uparrow m \end{array} \end{array}\right), C\left(\begin{array}{c} \begin{array}{cc} \uparrow m & \uparrow n \\ | & | \\ \leftarrow k-2 & \rightarrow k-2 \\ | & | \\ \uparrow n & \uparrow m \end{array} \end{array}\right)\right) \text{ is } 4.$$

Fork Sliding

Lemma

$$C\left(\begin{array}{c} \nearrow^m \searrow^l \\ \uparrow^n \\ \hline m+l \end{array}\right) \approx C\left(\begin{array}{c} \nearrow^m \searrow^l \\ \hline \uparrow^n \\ m+l \end{array}\right).$$

Reidemeister Moves – Main Theorem

Theorem

The $\mathbb{Z}_2 \oplus \mathbb{Z} \oplus \mathbb{Z}$ -graded colored $\mathfrak{sl}(N)$ -homology is invariant under Reidemeister moves.

Proof

Open Problems

- Is the \mathbb{Z}_2 -grading concentrated?

Open Problems

- ▶ Is the \mathbb{Z}_2 -grading concentrated?
- ▶ Is the Euler characteristic equal to the corresponding colored $\mathfrak{sl}(N)$ -polynomial? (MOY equations do not completely determine the colored graphic $\mathfrak{sl}(N)$ -polynomial.)

Open Problems

- ▶ Is the \mathbb{Z}_2 -grading concentrated?
- ▶ Is the Euler characteristic equal to the corresponding colored $\mathfrak{sl}(N)$ -polynomial? (MOY equations do not completely determine the colored graphic $\mathfrak{sl}(N)$ -polynomial.)
- ▶ Functorality? (Khovanov and Rozansky's proof should carry over. But the algebra looks much harder.)

Generalizations

- ▶ Lee-Gornik deformation. (Definition and invariance look easy. The Lee-Gornik basis is hard to construct. We can probably still get colored $\mathfrak{sl}(N)$ -Rasmussen invariants and genus bounds.)

Generalizations

- ▶ Lee-Gornik deformation. (Definition and invariance look easy. The Lee-Gornik basis is hard to construct. We can probably still get colored $\mathfrak{sl}(N)$ -Rasmussen invariants and genus bounds.)
- ▶ Categorification of the colored $\mathfrak{sl}(N)$ -polynomial of links colored by general representations of $\mathfrak{sl}(N)$. (Probably do not carry any more topological information.)

Generalizations

- ▶ Lee-Gornik deformation. (Definition and invariance look easy. The Lee-Gornik basis is hard to construct. We can probably still get colored $\mathfrak{sl}(N)$ -Rasmussen invariants and genus bounds.)
- ▶ Categorification of the colored $\mathfrak{sl}(N)$ -polynomial of links colored by general representations of $\mathfrak{sl}(N)$. (Probably do not carry any more topological information.)
- ▶ Categorification of the $\mathfrak{sl}(N)$ -invariant for 3-manifolds. (Holy Grail?)
